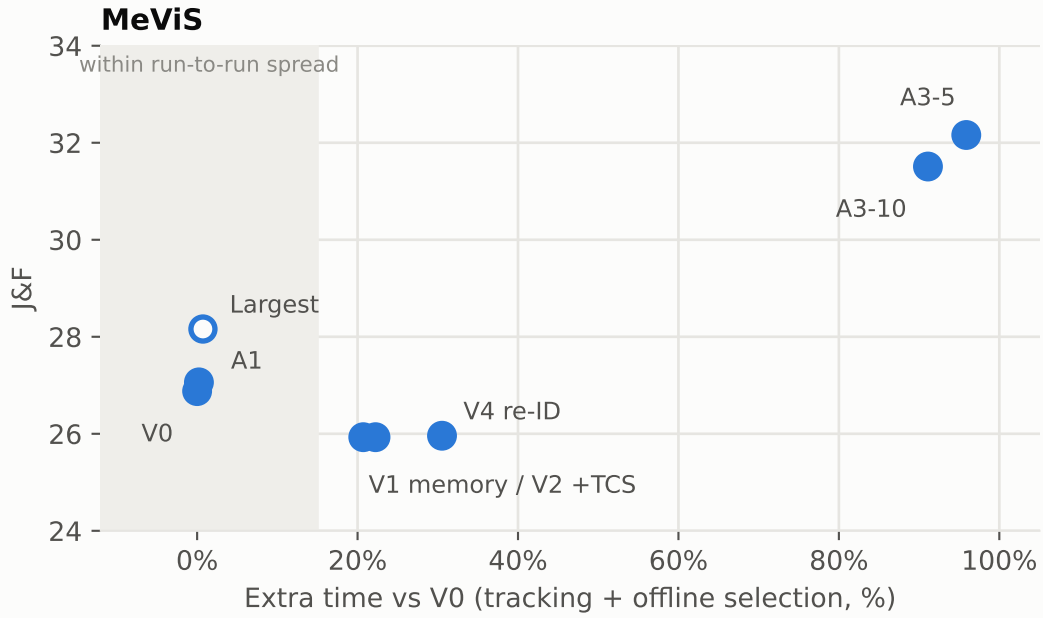
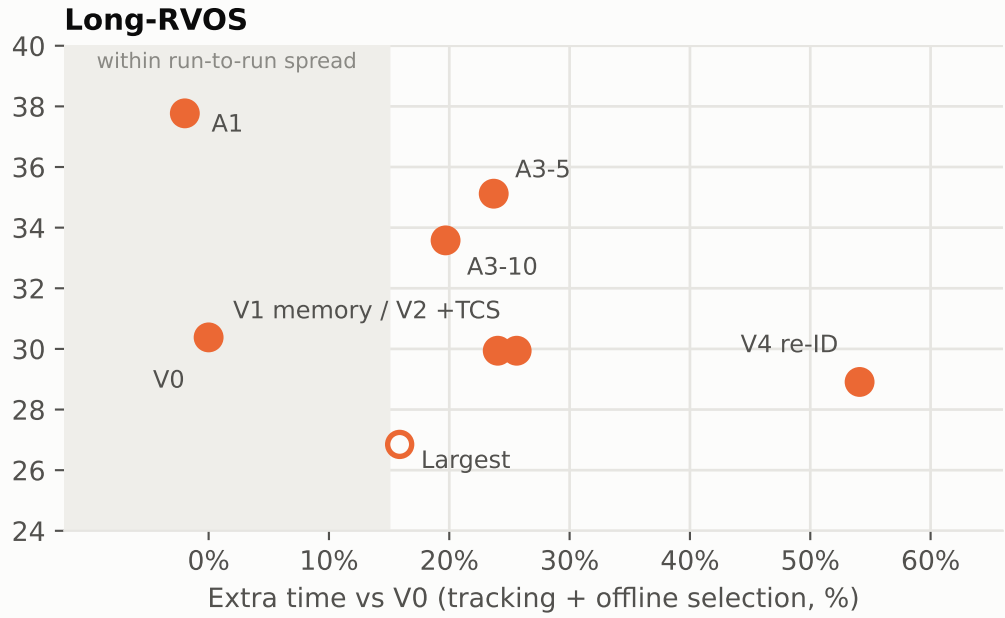
Memory, TCS and re-ID add 21-54% time with no J&F gain; the A3 gain on MeViS needs an offline pass





Grey band: differences under about 15% are not interpreted (the same V0 tracker differed by about 5% on MeViS and 13% on Long-RVOS between runs).
A1 and A3 include their offline selection time (A3: one SAM 2 look-ahead pass shared by N = 5 and N = 10, counted in full for each). Hollow marker: largest box, selection time not measured.
V4 re-ID on Long-RVOS tracked 10 of 11 videos; its +54.1% is against V0 on the same 10 videos. V3 and V4+VLM are left out (one live video per dataset, no timing file).
Peak memory: V0 about 0.7-0.8 GB; V1 about 0.8-0.9 GB; V2 about 1.4 GB; V4 re-ID about 1.7 GB. Selected subsets, single runs; not official benchmark results. Sentences of one video are not independent.
